THE DEVORE SPRING HINGE

Full Size Cut of No. 1.

JAPANNED.

No. 1 3 x 3 inches Coppered Steel Spring

O. V. & S.

per dozen pairs

This Hinge has uniform tension; holds the door firmly when closed, and when the door opens 130 degrees the action of the Spring reverses and holds it open. This Hinge makes but a quarter turn on the coil in opening the door to its fullest extent, admitting of the application of one-half more tension at the closing point. It requires no adjustment, the requisite tension being applied at the factory. The coil contains one-third more wire than is used in other hinges, allowing the application of stronger tension without danger of setting the wire. The leaves of the hinge are always in line, hence easily attached to door and jamb. All the desirable features of a Spring Hinge in a combination so simple that it cannot get out of order, and which we are enabled to offer to the trade at a satisfactory price. This Spring Hinge has been on the market for four years, and has given universal satisfaction.

SINGLE ACTING
SURFACE SPRING HINGES .

Full Size Cut of No. 0.

The Eclipse Door Springs can be used either with or without the Eclipse Door Check. The Spring is adjustable tension, made from extra heavy steel of the best quality, oil tempered. The power is greatest when the door is closed, and gradually decreases as the door opens. The above cut represents the smallest size of the Right Hand Springs. A Template with full directions for applying to door is packed with each Spring. All parts are interchangeable, so that in case of breakage any part can be obtained at small expense. Anybody can repair it.

WIRE DOOR SPRINGS

"TORREY."

MALLEABLE IRON, STEEL ROD.

PACKED WITH SCREWS.

Torrey, Japanned

per dozen, \$

SPIRAL DOOR SPRINGS

There are no detached pieces to this Spring to be mislaid. It requires no special tool or wrench to put it on the door and set the Tension—a screw-driver will do it all. A nail or any thin piece of iron is all the tool that is required to tighten or relieve the tension of the Spring when desired.

MIHILL'S SELF LOCKING HASP LOCKS

Half Size Cut of No. 4101. Locked.

Half Size Cut of No. 4101. Unlocked.

GENERAL DESCRIPTION.

This Lock combines in one article the practical working of a Hasp and Staple with Hook, and a Hasp and Staple with a Padlock, inseparable, and still leaving it optional with the consumer to use them separate or together, necessitating the use of the key only to unlock.

Made of Iron, Self-locking, four "Patent Wards." Fine Flat Bow Keys. All different in a dozen. Packed with two Tinned Staples to each Lock. The Iron Locks have a Nickel Plated Finish to prevent them from rusting.

COOK'S SASH SUPPORT AND LOCK

Cut showing Mortise Lock.

UPPER SASH LOWERED, LOWER SASH RAISED.

Cut showing Surface Lock.

This invention stands alone as the one practical device ever made for the purpose. It is in no way to be confounded with ordinary "Window Fasteners." It ranks with the Weight and Pulley, and while it is desirable in a common window as Weights and Pulleys are in a heavy window, it costs less than one-fourth as much. With Weights and Pulleys it is the best Lock.

WHAT THEY WILL DO.

- 1--They will hold either sash, upper or lower, at any point the same as Weights.
- 2--They will lock either sash, whether closed or open for ventilation, leaving your windows as safe as your doors.
- 3--They will prevent the sashes falling if meddled with by children or carelessly handled.
- 4--They will permit the use of both hands in moving the sashes.
- 5--They will keep in order and not wear out in a lifetime.
- 6--They will always look neat, and leave your sashes and window frames the same.
- 7--They will go on old windows as well as new.

J. F. WOLLENSAK'S PATENT TRANSOM LIFTERS AND LOCKS

VENTILATION MADE EASY.

With these devices Transoms are opened and closed at will with ease, and locked in any position. No other fastenings required. Anyone can put them on. Celebrated for Simplicity, Neatness and Efficiency. They never get out of repair.

Made any length from three feet up.

No allowance made for shorter lengths than given in the list below.

Special Brackets furnished for deeply recessed Transoms.

REQUIREMENTS:

For Light Transoms $\frac{1}{4}$ and 5-16 inch, and for Heavy Transoms $\frac{3}{8}$ and $\frac{1}{2}$ inch Lifters. When ordering give the Class, Number, Diameter and Length—four feet less than the height of the door usually determines the length required. Classes 3 used in three ways, as shown in cuts. All the Lifters shown here are reversible from right to left side. Place the Lifter on the side next to the door knob and near the edge of the finish. Heavy Transoms, when hinged at top or bottom, should have a Lifter on each side. The pivots on Class 1 should be sufficiently out of the centre to counteract the weight of the Lifter, so when the latter is on all will balance.

PRICE EACH:

| ROUND ROD LIFTERS. | Length of Rod. | Diameter of Rod. | Price Each. | Flat Rod Lifters. | Length of Rod. | Price Each. |
|--------------------|--------------------------------------|---|-------------|-------------------|----------------|-------------|
| CLASS 1 and 3 | 3 feet 3 feet 4 feet 5 feet | $\frac{1}{4}$ in. 5-16 in. $\frac{3}{8}$ in. $\frac{1}{2}$ in. | \$ | Crown No. 43. | 3 feet | \$ |
| CLASS 4 | 3 feet 3 feet 4 feet 5 feet | $\frac{1}{4}$ in. 5-16 in. $\frac{3}{8}$ in. $\frac{1}{2}$ in. | \$ | Star No. 83. | 3 feet | \$ |

"ACME" DRAWER LOCKS

Full Size Cut of No. 1606.

No. 1606. 2 1/4 inch IRON. 3 Keys 4 Keys 6 Keys 12 Keys to dozen.
 \$0 85 90 95 1 15

We claim for the "ACME" LOCK that it has no knife edges bearing against the sides of the mortise.

That the selvedge is strongly supported by the holding wings, so that it is impossible to bend it down or break it off when the lock is pushed into a tight mortise.

That the wings converge slightly at the bottom, so that the lock will fit mortises varying somewhat in width.

That the lock when inserted fits snugly and gives the work on which it is used a finished appearance.

That the whole surface of the wings crossing the grain of the wood tends to hold the lock firmly in the mortise.

We call attention to the style of Router Bits shown above. They have knives which are easily sharpened without changing the shape of the mortise which they cut. They are made so that the pieces are interchangeable, and are so constructed that they will stand in any wood used in the manufacture of drawer fronts.

IRON CARRIAGE AND GAUGE FOR MORTISING.

When ordering Circular Saws the following directions should be explicitly given:

Diameter of saw in inches.

Thickness or gauge of saw at rim.

Thickness or gauge of saw at centre.

Right or left hand saw (see engraving above).

Number of teeth in saw.

Size of mandrel hole.

Size of pin holes.

Distance between pin holes from centre to centre.

Greatest feed at each revolution of saw in inches.

Kind of lumber to be sawed.

Number of revolutions of saw per minute.

Whether swedge or set.

N. B.—All our saws for stock above 48 inches in diameter are made with $2\frac{1}{2}$ inch mandrel hole and $\frac{3}{4}$ inch pin holes, and $4\frac{1}{4}$ inches from centre to centre. If wanted different, please send full patterns of holes.

A very correct way to get the size of the holes is to place a piece of writing paper on the inside of the loose collar or flange, and press it round the holes with the finger, which will leave the impression of the eye and pin holes on the paper.

POWER USED BY CIRCULAR SAWS

The following table shows the power used by Circular Saws of different thicknesses, feed and teeth. It is valuable to mill men and sawyers, as it is the only instance we are aware of where the test was by actual measurement. These figures were taken at a trial in Cincinnati in the year 1874. It also destroys the theory of thin saws with fine teeth, or thick saws with fine teeth, using less power. As will be seen by this trial, the 56 inch saw, 7 and 11 gauge, 42 teeth, used 100½ horse power, while the saw with 40 teeth, 5 and 7 gauge, only used 95½ horse power, while the saw with 50 teeth, 6 and 7 gauge, used the most power, a little over 120 horse power. It also proves that circular saws take very much more power than is generally supposed.

| SIZE. | Gauge. | TEETH. | FEED. | HORSE POWER. | SIZE. | Gauge. | TEETH. | FEED. | HORSE POWER. |
|-------|----------|--------|-------|--------------|-------|----------|--------|-------|--------------|
| 56 | 5 and 7 | 40 | 3½ | 95.48 | 56 | 7 and 8 | 40 | 2½ | 105.49 |
| 56 | 5 and 7 | 40 | 2½ | 111.08 | 56 | 7 and 8 | 34 | 3½ | 112.98 |
| 56 | 7 and 11 | 42 | 2½ | 100.68 | 56 | 7 and 8 | 34 | 2½ | 114.24 |
| 56 | 8 and 9 | 48 | 2½ | 99.23 | 56 | 5 and 8 | 36 | 3½ | 112.18 |
| 56 | 8 and 9 | 48 | 2½ | 118.62 | 56 | 5 and 7 | 36 | 3½ | 114.75 |
| 56 | 6 and 8 | 40 | 3½ | 104.95 | 56 | 5 and 7 | 36 | 2½ | 98.92 |
| 56 | 6 and 8 | 40 | 2½ | 97.96 | 56 | 6 and 7 | 30 | 3½ | 102.05 |
| 56 | 6 and 7 | 50 | 3½ | 120.16 | 56 | 6 and 7 | 30 | 2½ | 112.12 |
| 56 | 6 and 7 | 50 | 2½ | 121.63 | 56 | 8 and 10 | 50 | 3½ | 81.24 |
| 56 | 7 and 8 | 40 | 3½ | 117.33 | 56 | 8 and 10 | 50 | 2½ | 101.42 |

THE MOTION OF CIRCULAR SAWS.

This is one of the most essential things to be observed, and no one can give this too much attention. If the speed of the saw is too high, it can not do good work, besides rendering it liable to many accidents. It generates heat in the saw, makes it touchy and limber, and it will only run and do good work on light feed, and while the teeth are in the best of order, and have a keen, sharp, cutting corner; as soon as this is gone, the saw will run or dodge whenever it comes in contact with the least obstacle. And again: Too low a speed has its objections, but it is not attended with such ruinous effects upon the saw. These difficulties can be remedied to a limited extent by the hammering of the saw, but can not be entirely overcome.

RULES FOR CALCULATING THE SPEED OF SAWS, PULLEYS OR DRUMS.

PROBLEM 1.—The diameter of the driven being given, to find its number of revolutions.

RULE.—Multiply the diameter of the driver by its number of revolutions, and divide the product by the diameter of the driven; the quotient will be the number of revolutions of the driven.

PROBLEM 2.—The diameter and revolutions of the driver being given, to find the diameter of the driven, that shall make any given number of revolutions in the same time.

RULE.—Multiply the diameter of the driver by its number of revolutions, and divide the product by the number of revolutions of the driven; the quotient will be its diameter.

PROBLEM 3.—To ascertain the size of the driver.

RULE.—Multiply the diameter of the driven by the number of revolutions you wish it to make, and divide the product by the revolutions of the driver; the quotient will be the size of the driver.

TERMS OF WARRANTY.

Each saw is warranted to be made of the best material, free from seams or flaws, and as true as possible. If found defective in either of these particulars, a new one will be given in exchange if returned within a reasonable time.

The greatest care is taken that every saw shall be true and of even temper.

The practice of using a cold chisel for retreating a saw is almost certain to crack it, and corners filed square in the gullet of the tooth will frequently produce the same result, particularly in frosty weather. Alterations made in mandrel or pin holes, by filing or reaming, will almost invariably spring the plate. We do not warrant saws when used on a hot mandrel.

Saws subjected to the above practices are not covered by our warranty.

Saws, when sent to be remade, are at the owner's risk—both as regards breakage and quality.

We know it is impossible to make a saw mathematically true, but we can approach as near that point as is practically useful; and we believe that many times circular saws are condemned when the fault is with the mandrel or machinery instead of the saw. It is a difficult matter to turn a mandrel on centres in a lathe that will run true in bearings on its journals, and any deviation from perfect truth in the flanch is multiplied as many times in the saw as the saw is larger than the flanch; therefore the flanch or collar should be turned true while the mandrel is in its proper bearings. A true mandrel will help a bad saw, but a bad mandrel will spoil a good saw.

In justice to ourselves and the trade, we will here say that our warranty does not cover breakage in saws that leave our works set and filed, as all such breakage in setting is the result of some improper method—such as imperfect saw sets, operating on the saw when charged with frost, carelessness, etc. The fact of the first set being a more severe test than any set afterwards, is sufficient evidence that the operator and not the saw is at fault.

REPAIRING NET CASH.

All goods returned on warranty, or otherwise, must be at the expense of the shipper.

All goods returned on warranty must be within thirty days from date of purchase or will not be accepted.

Goods shipped at purchaser's risk.

DIRECTIONS FOR HANGING CIRCULAR SAWS

HANGING THE SAW.

Great care should be taken in this, as much depends on the hanging and lining of the saw. First examine with a straight-edge the collars; sometimes it will be found that the iron, around where the steady pins are driven, will be raised, so as to cause a bunch around the pins; if so, either file or cut it off with a sharp cold-chisel. *A true mandrel will help a bad saw, but a bad mandrel will soon spoil a good saw.* The mandrel must be level, so as to allow the saw to hang plumb, and be as tight in the boxes as it will run without heating, and little or no endwise motion. (We are aware that the latter will not agree with all sawyers' views, for sometimes endwise or lateral motion has to be given to favor a bad saw, but we are alluding to saws that are in proper condition.) The saw should hang on the collars so as to be perfectly flat on the log side, and collars should be a little concave. There should be great care taken to see that the saw does not bind on the pins, or that the eye does not fit too tightly on the mandrel; if it does, the least warmth of the mandrel will be sure to cause it to expand, bind, and spring the saw. It is not to be expected that every saw will hang perfectly true, or all hang the same, even on the same collars. Although the saws may be perfectly true, any deviation from perfection in the collars, or the saw, is multiplied as many times in the saw as the saw is larger than the collars. When a saw is found to be rounding or crooked on the log side, after fastening between the collars, loosen the nut and collars and put a straight edge upon the log side of the saw, and ascertain whether the fault is in the saw or in the collars. This should be done before it is used. Saws are often pronounced crooked when the fault is in the collars. We do not wish to be held responsible for the various shapes that bad collars may put a saw into; these imperfections may, however, be adjusted by packing writing paper between the saw and the collars. Any alteration in the way of filing or reaming, or otherwise, will almost invariably spring the saw, and render it unfit for use. *The greatest care should be taken to keep the saw on a line with the run of the carriage.* The saw should run nearly on a line with the carriage; the front of the saw inclining a little to the log so that the back part may raise without the teeth cutting or scratching the timber. *A badly running carriage is ruinous to saws.* The guides should be run as closely as they can without pinching the saw, so as not to heat on the rim and below the bottom of the teeth. It is not well to move the guides when the saw is warm, as the warmth may change its position. The practice of throwing water on the saw when warm is very bad and should never be done. It may, however, be used to prevent pitch and gum from adhering to the saw—it keeps it clean and lessens the friction when used in a proper manner, and has no injurious effect upon the saw. When used, it should be applied on both sides, and put on when the saw is cool, near the eye, in a very small stream. The motion of the saw throws it over the surface to the verge, thereby producing the effect above mentioned. Great care should be taken to keep the box next the saw from heating, as the heat is conveyed to the saw. The least heat in the centre of a saw will make it limber and cause it to dodge. A saw that is in proper condition should never have anything to cause friction in the eye or on the rim that can be avoided. The journal next the saw should not have any shoulders or collar to bear against the box, leaving everything free and clear. The mandrel can be as well and better secured with collars on the outer and inner of the opposite box.

DIRECTIONS FOR LINING THE SAW.

Run the carriage up so that one of the head-blocks will be opposite the centre of the saw; then holding a small piece of board or stick on the head-block and let the end touch the centre of the saw; keep the board or stick in exactly the same place on the head-block, and run the carriage back so that the head-block will stand about twenty feet from the front of the saw; then draw a fine line from the point of the stick past the saw, which should stand one-eighth to one-quarter of an inch in twenty feet, the front inclining towards the carriage. Some saws require a trifle more, and some less.

SETTING AND SHARPENING.

Too few sawyers realize that this is one of the chief points of success in running a circular saw-mill, as a good saw not properly filed and set cannot do good work. Many good sawyers both set and upset with good success. This is done by first setting each alternate tooth and then spreading the point with an "upset" or "swedge," measuring with the gauge that each is set exactly alike; then file the underside of the tooth to a sharp point, being careful that the point toward which the tooth is set be left full. The back of the tooth should be filed square across, and only sufficient to bring it to a keen cutting edge falling off from the point to give the back of the tooth sufficient clearance. The most of the filing should be done on the face or under side of the tooth. The "pitch" of the saw should be carefully looked to. For ordinary lumber a line drawn from the point of the tooth tangent to the circumference of a circle $\frac{3}{8}$ the diameter of the saw will be about right. This varies, however, according to the kinds of lumber to be sawed. For soft wood more "pitch" should be given to the tooth. When the upset only is used, see that the point is well braced by being upset back $\frac{1}{8}$ to $\frac{1}{4}$ of an inch—the set being fullest, of course, on the extreme point, and gradually diminishing back from the point. The throats of the teeth should be kept sufficiently open to carry out the shaving or accumulated dust without choking, and to this end we recommend the use of the "burr" or "die" gunner. This is also advantageous in regulating the "pitch" of the tooth, and may be used without taking the saw from the arbor, which is desirable when once properly adjusted. Should the saw at any time become warm there is something wrong, and the mill should be stopped until the difficulty is ascertained and remedied.

SUGGESTIONS FOR THE USE OF BAND SAWS.

Keep the correct pitch upon the tooth, so as to give a proper lead into the cut. This will take the friction entirely off the stay-pin. By the use of a round edge file the saw will be kept from galling. To save trouble and expense a proper pitch must be held for each kind of wood and work.

MIXTER'S FAMOUS CHAMPION GUMMER

This cut represents MIXTER'S FAMOUS CHAMPION GUMMER, with the new Patent Adjustable Automatic Feed Attachment, that can be regulated at will to feed faster or slower, according to the work to be performed; and can be changed in a instant from self-feeding to hand-feeding.

It is self-adjusting—throwing itself out of gear when the teeth are cut to the required depth. The feeding process is so true and even, and so far superior to the old hand-feed, that we can harden our cutters to the very highest temper, with little or no danger of breaking (which is often caused by the irregularity of hand-feeding), and the Cutters will wear at least three times as long. We guarantee it to be THE MOST PERFECT GUMMER EVER MADE. It will pay you to throw away your old Gummer and order the Champion.

Price of Gummer with Three Cutters, Grinder and Wrench, \$24.00.

Cutters, $\frac{3}{4}$ inch, 90c.; $\frac{7}{8}$ inch, \$1.00; 1 inch, \$1.10; $1\frac{1}{8}$ inch, \$1.20; $1\frac{1}{4}$ inch, \$1.30; $1\frac{1}{2}$ inch, \$1.60.

Cutters for small saws, $\frac{3}{8}$ inch 75c., $\frac{1}{2}$ inch, 80c.; $\frac{5}{8}$ inch, 85c.

Extra Arbor for small saws to carry $\frac{3}{8}$, $\frac{1}{2}$ and $\frac{5}{8}$ inch Cutters, \$2.25.

THE CONQUEROR SWAGE, JUMPER OR UPSET

No. 1

- No. 00 For Large Circular Saws \$ each
 No. 0 For Large Circular Saws " "
 No. 1 For Large Circular Saws, as per Cut " "
 No. 2 For Small Circular and Mill Saws " "
 No. 3 For Band Saws and Small Circular Saws " "

The lower opening in the swage being rounding on the bottom, takes its bearing on the centre of the tooth, spreading and shaping it as shown on section of tooth *II*. The upper opening (in which section of tooth is inserted) is used for squaring up, and leaves the tooth as shown *G*.

The teeth of a saw require to be swaged to a sharp, keen edge, and the bottom of the openings in the Conqueror being slotted it is impossible to blunt or injure the fine cutting edge of the tooth, which is frequently done by other swages. One of the principle drawbacks in the manufacture of solid swages has been the difficulty experienced in properly hardening them at the bottom of the opening, which portion of swage does all the work, and requires to be hardened in the most perfect manner.

The Conqueror is hardened before the sleeve is driven on, and the hardening composition passes freely through the slots at the bottom of the openings, thus insuring an even and correct hardening in that portion of the swage where it is most required.

Numbers 00 and 0 have Projecting Tongues.

WITH SELF-OILING BOXES.

Made from best English steel and well finished.
 Cannot get out of line, as the bed is solid.

These Saws have all the latest improvements in hand saws. They combine the popular "Skew-Back," the peculiar shaped butt or heel, which, with the new screws, makes it almost impossible to work loose from the handle, and gives the full sweep of the saw without the possibility of catching in the work. All the above features are patented.

DISSTON'S IMPROVED PRUNING SAW & KNIFE.

Patented August 29, 1873.

Japanned Frame, \$ per dozen.

This saw is designed for attachment to a pole; so the upper branches of trees can be readily pruned without the aid of a ladder, the knife or saw being brought into requisition as may be required.

When desirable, the pole can be readily detached; the socket on the frame forming an excellent handle.

The peculiar formation of the tooth enables the saw to cut both ways, causes an equal strain on the limb, insures smooth and rapid execution, and prevents the saw from becoming jammed in cutting green wood.

GAUGE FOR REGULATING CLEANING-TEETH

Showing the Gauge in position for filing the Cleaner-Tooth.

| | |
|-----------|---------------|
| Saw Gauge | per dozen, \$ |
|-----------|---------------|

The cleaning teeth of all saws should be somewhat shorter than the cutting teeth, and, although shortened, should be of uniform length throughout.

The inner edge of the Gauge rests on the points of the cutting teeth, the cleaning tooth projecting through the opening in the centre of Gauge. File the projecting point until arrested by the edge of the Gauge, which is made of hardened steel. Thus tooth after tooth can be rapidly and correctly reduced to an even length by any unskilled operator.

CHAPLIN'S PATENT.

THE STANLEY ADJUSTABLE PLANES

BULL NOSE RABBIT PLANE.

No. 75 Iron Stock, 4 inches in length, 1 inch Cutter each, **\$0 50**

STANLEY ADJUSTABLE SCRAPER PLANE.

This Tool, by its peculiar construction, can be used for scraping and finishing Veneers, Cabinet Work or Hard woods in any form, or it can be used equally well as a Tooth Plane.

No. 112 Adjustable Scraper Plane, 9 inches in length, 3 inch Cutter each, **\$3 00**
 Cutters for Veneer Scraping each, **25**
 Cutters, for Troughing, Nos. 22, 28, 32 (22, 28 or 32 teeth per inch) each, **35**

MILLER'S PATENT PLOW, FILLETSTER AND MATCHING PLANE.

With each Tool eight forged Plow Bits (1-8, 3-16, 1-4, 5-16, 3-8, 7-16, 1-2 and 5-8 inch), a Filletster Cutter and a Slitting Blade, are furnished; also a Troughing Tool (1-4 inch), and by use of the latter, with the 1-4 inch Plow Bit for grooving, a perfect Matching Plane is made.

COMBINED PLOW, FILLETSTER AND MATCHING PLANE.

No. 41 Iron Stock and Fence each, **\$9 00**
 No. 42 Gun Metal Stock and Fence each, **12 00**

COMBINED PLOW AND MATCHING PLANE—WITHOUT FILLETSTER.

No. 43 Iron Stock and Fence each, **\$7 00**

ADJUSTABLE CIRCULAR PLANE.

No. 113 Adjustable Circular, 1 1/4 inch Cutter, each, **\$4 00**

This Plane has a Flexible Steel Face, which can be easily shaped to any required arc, either concave or convex, by turning the Knob on the front of the Plane.

BAILEY'S ADJUSTABLE VENEER SCRAPER.

No. 12 3 inch Cutter each, **\$3 50**

TRAUT'S PATENT ADJUSTABLE DADO, FILLETSTER, PLOW, ETC.

By attaching the Guard Plate (shown above) to the Sliding Section, the Tool may be readily converted into a Plow, a Filletster or a Matching Plane—as explained in the printed instructions that go with every Tool.

This Tool is accompanied by eight Plow and Dado Bits (3-16, 1-4, 5-16, 3-8, 1-2, 5-8, 7-8 and 1 1-4 inch), a Filletster Cutter, a Slitting Blade and a Troughing Tool. All except the Slitting Blade are secured in the main stock on a Skew.

ADJUSTABLE DADO, FILLETSTER, PLOW, ETC.

No. 46 Iron Stock and Fence each, **\$7 00**

ADJUSTABLE DADO.

Including Bits 3-8, 1-2, 5-8, 7-8 and 1 1-4 inch.
 No. 47 Iron Stock and Fence each, **\$4 00**

IMPROVED TRAMMEL POINTS

These Tools are used by Millwrights, Machinists, Carpenters, and all mechanics having occasion to strike arcs or circles larger than can be conveniently done with ordinary Compass Dividers. They may be used on a straight, wooden bar of any length, and when secured in position by the thumbscrews, all circular work can be readily laid out by their use. They are made of Bronze Metal and have Steel Points, either of which can be removed and replaced by the Pencil Socket, which accompanies each pair, should a pencil mark be preferred in laying out work.

STEEL SWEEP, MAHOGANY HEAD
AND HANDLE.

No. 303 9 inch Sweep per dozen, \$
 No. 305 10 inch Sweep per dozen,

This Implement combines all the advantages of the regular Bit Brace with those of the Adjustable Socket Wrench; it can be adapted as a wrench to turn with great rapidity nuts and bolts of all shapes and sizes from $\frac{1}{4}$ to $1\frac{1}{4}$ inch with it can be used any Auger or other Bits made use of in the ordinary Brace. It is peculiarly adapted to the use of mechanics, blacksmiths, carriage builders, agricultural implement manufacturers, millwrights, and in fact all branches of trade where nuts and bolts are used, combining as it does both a Bit Brace and an Adjustable Socket Wrench. This tool has Lignumvitte Head, Revolving Rosewood Handle, the Sweep of highly finished steel, and the Jaws are made of cast steel.

No. 27 Nickel Plated per dozen, \$

CUTLERY * DEPARTMENT

....

- The following pages are not intended to illustrate our complete stock, but are a few of the leading lines which we always have in stock.
- It is impossible to illustrate our complete line of Cutlery on account of our introducing new designs and styles from time to time, but our Travellers carry samples of all lines not herein illustrated.
- Our Stock in this department is complete with the finest selections to be found in Canada, and comprises the best makers of Europe and America.

.....

PLATED * AND * FLATWARE

....

- Our Stock in this department is very complete. We have a great variety of lines manufactured by well known American and Canadian firms, while our stock of Novelties manufactured by English and German makers, is very full and complete, and has to be seen to be appreciated.
- We endeavor to lead the market in this line of goods, and our European buyer attends particularly to the selection of lines suitable for use in this country. By this means our stock is always new and of pleasing designs.
- We find it impossible to illustrate the complete line of Plated Goods. While we have illustrated the American Goods fairly, we think it advisable for our Travellers to carry Photographs and Samples of all Lines, which they will show for selection from time to time when calling upon you.

Canadian Institute for Historical Microreproductions / Institut canadien de microreproductions historiques

© 1993

The copy filmed here has been reproduced thanks to the generosity of:

D. B. Weldon Library
University of Western Ontario

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

The last recorded frame on each microfiche shall contain the symbol → (meaning "CONTINUED"), or the symbol ▼ (meaning "END"), whichever applies.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left hand corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

L'exemplaire filmé fut reproduit grâce à la générosité de:

D. B. Weldon Library
University of Western Ontario

Les images suivantes ont été reproduites avec le plus grand soin, compte tenu de la condition et de la netteté de l'exemplaire filmé, et en conformité avec les conditions du contrat de filmage.

Les exemplaires originaux dont la couverture en papier est imprimée sont filmés en commençant par le premier plat et en terminant soit par la dernière page qui comporte une empreinte d'impression ou d'illustration, soit par le second plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par la première page qui comporte une empreinte d'impression ou d'illustration et en terminant par la dernière page qui comporte une telle empreinte.

Un des symboles suivants apparaîtra sur la dernière image de chaque microfiche, selon le cas: le symbole → signifie "A SUIVRE", le symbole ▼ signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être filmés à des taux de réduction différents. Lorsque le document est trop grand pour être reproduit en un seul cliché, il est filmé à partir de l'angle supérieur gauche, de gauche à droite, et de haut en bas, en prenant le nombre d'images nécessaire. Les diagrammes suivants illustrent la méthode.
